

MI-8 Beam Dump

Removal of Long 13 Extraction
Coming Soon – Fall 2005

Pro Removal

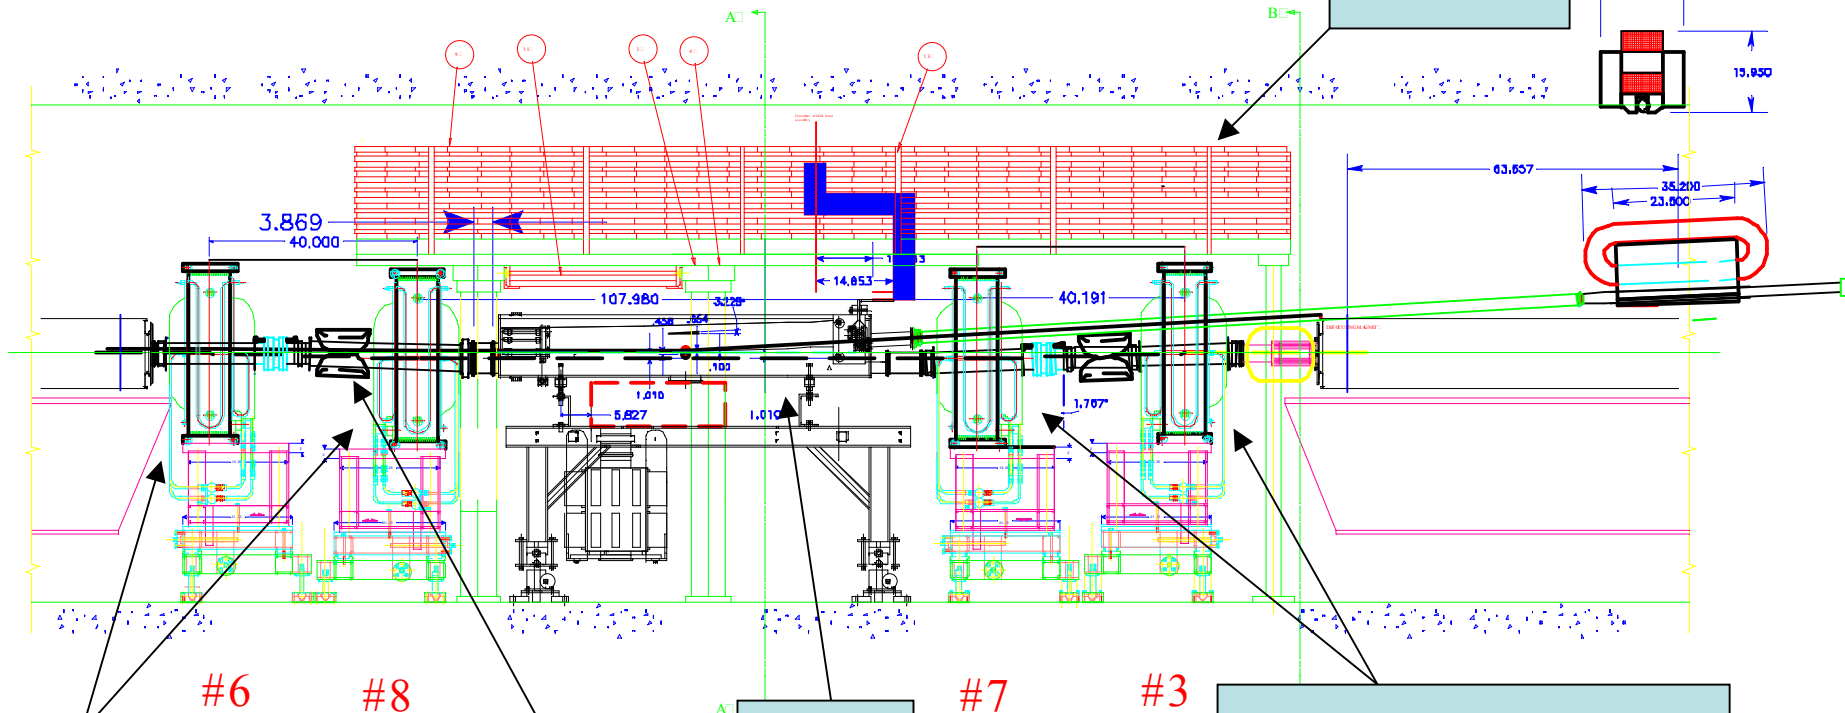

- Edge Focusing Issue
- Aperture/Alignment Issues
- Tuning Issues
- L3 Extraction Issues
- Real estate
- Activation – component failure

Con Removal

- We Know How It Works
- RDF
- MI-8 Line Beam Loss Issues
- Operating Constraints
- \$\$
- Utilities – BWG water demand

Present L13 Layout
Installed Fall Shutdown 2004

Shielding
Only L3

Upstream Doglegs

Bex Bump

Septa

Downstream Doglegs

L13

Edge Focusing

- The linear optics of the Booster is perturbed by the edge focusing of the extraction orbit bumps*.
- Although reduced with new L13 design the effects remain.

* C. Ankenbrandt, W. Chou, A. Drozhdin, J. Lackey, P. Lucas, F. Ostigay, M. Popovic, FNAL, Batavia, IL 60510, USA,

“The Edge Focusing Effect of Injection and Extraction Orbit Bumps in the Fermilab Booster”

Simulated Lattice Numbers A. Drozhdin

No L-13 extraction

- Total Length = 474.204066 Qx = 6.702875 Qy = 6.833608
- Delta(s) = 0.000000 mm Qx' = -22.029112 Qy' = 10.248640
- alfa = 0.336600E-01 betax(max)= 35.940595 betay(max)=26.412676
- gamma(tr) = 5.450585
- Dx(max) = 3.621426 Dy(max) = 0.022589
- Dx(r.m.s.)= 2.484070 Dy(r.m.s.)= 0.002658
- xco(max) = 0.000000 yco(max) = 0.000000
- xco(r.m.s.)= 0.000000 yco(r.m.s.)=0.000000

With extraction at Long-13

- Total Length=474.204489 Qx = 6.711246 Qy = 6.818725
- Delta(s) = 0.000000 mm Qx' = -21.962812 Qy' = 10.184168
- alfa = 0.335145E-01 betax(max)= 36.048296 betay(max)=25.792870
- gamma(tr) = 5.462400
- Dx(max) = 3.847574 Dy(max) = 0.021389
- Dx(r.m.s.)= 2.480990 Dy(r.m.s.)= 0.003719
- xco(max) = 0.000000 yco(max) = 0.000000
- xco(r.m.s.)= 0.000000 yco(r.m.s.)=0.000000

Aperture/Alignment Issues

- The calculated aperture is approximately 80mm(H) by 60mm(V). Large enough to accept 20 pi beam. The actual aperture as measured by scans is 44mm H by 20mm V.
 1. There is some error in the scan data do to scraping outside the area of measurement.
 2. Alignment error may explain part of the discrepancy.
 3. The local beta bumps may result in an increased vertical beam size.

Tuning Issues

- The region is not as shielded as the L3 extraction region.
 - BLM limits are set lower than L3
 - Efficiencies above 87% still require collimating to reduce losses to acceptable limits
- The tuning at L13 is critical for L3 extraction (ring wide beam loss issues)
 - L13 bex bump, septa and dogleg tuning
 - Vertical tune
 - Extraction Kickers at L2 for use at L3 is limited

MI-8 Dump Operation

- Total Beam expected is $\sim 1\text{E}19$ p/yr
- L13 dump integrated protons $\sim 2.9\text{E}18$ p/yr
- MI-8 design goal is $1\text{E}20$ p/yr
- Two operational modes
 - Short Batching to MI
 - Protons for colliding mode – Beam cycle \$15
 - Protons for fixed target mode – Beam cycle \$13
 - Booster Study Cycles – Beam cycle \$17
 - MI secured – V803B is on
 - MI Rad permit down – V803B is off, Beam stop closed

Kicker(s) at L12 can be used to extract beam at L3. This will allow L3 extraction kickers (MKS05,06,07,08) to be turned down. Higher kicker lifetime and operational spare.

Kickers at L2 and L12
When Kick at L12 is flipped

MP01 aperture issues

L3 Vertical position when Kicks are added

Activation - Septa

- Component failure in this region has been high. We have made improvements (peek water tubing) but other systems are still vulnerable.
- Caps, Correctors, Cables, Ion Pump....etc

Booster Abort Relocation Conduit Routing

May 23, 2005

Conclusion

- Removal of L13 extraction will be a noticeable improvement to Booster operations.
- Cost of relocation is small.
- Risk of relocation is small.
- Reduction in Booster activation levels

Thanks to AD mechanical, FESS, AD Safety
